Search tips

Simple search

The screenshot shows a search interface with a dark blue header. At the top right, there is a blue button labeled "Simple search". Below the header, there are several filter buttons: "All" (highlighted in teal), "Scholarly Journals", "Books", "Videos & Audio", "Dissertations & Theses", and "All source types" with a dropdown arrow. A search bar contains the text "hysterecto" with a red squiggly underline. To the right of the search bar is a teal search icon. Below the search bar, a dropdown menu lists suggestions: "hysterectomy and ethics", "hysterectomy and depression", "hysterectomy and complications", "hysterectomy and cancer", "hysterectomy and body image", "hysterectomy and bleeding", "hysterectomy and anxiety", "hysterectomy", "hysterectomies", and "'hysterectomy'". At the bottom of the dropdown is a link that says "Turn off auto-complete". A large orange arrow points from the left towards the first suggestion in the dropdown.

Auto-complete – suggesting search terms when entering them

Auto-complete function suggests search terms based on prior searches of ProQuest users. This list is updated when writing and it always contains prior searches beginning from the sequence of characters currently entered. You can click on any term to start searching for it.

Selecting „Turn off auto-complete” option deactivates suggestions for searched terms within the ProQuest session.

Research Assistant BETA

Brainstorm related research topics.

Describe the important concepts.

Here is the **key takeaway**.

Hysterectomy significantly influences women's life satisfaction, which is generally rated as 'rather satisfactory' across most life domains. Additional topics discussed in the text are: the psychological impact of hysterectomy on women's perceptions of femininity and sexual attractiveness, the role of socio-demographic factors in shaping women's fears and satisfaction post-surgery, and the variability of life satisfaction experiences among women undergoing the procedure. These topics are significant for researchers as they highlight the complex interplay between medical interventions and psychological, social, and demographic factors affecting women's health outcomes.

Understanding the feeling of life satisfaction in patients after hysterectomy is crucial, as it

The feeling of life satisfaction in patients after hysterectomy

Mazurek, Anna; Pięta, Beata. *Ginekologia Polska = Polish Gynecology*; Gdansk Vol. 83, Iss. 5, (2012).

By entering the „Abstract” tab you get familiar with details concerning the specific article

Abstract

Translate

Hide highlighting

Objectives: The aim of the study was to evaluate the feeling of life satisfaction in women after hysterectomy. Material and methods: A group of 131 women after hysterectomy was included in the study, patients of the PSPS Jan Boży Hospital in Lublin. 95 of the respondents were treated surgically because of benign gynaecological diseases, hysterectomy was performed in 36 patients because of malignant cancer of genital organs. The time between the end of the treatment and the day of the study was 3 to 12 months. 10 domains of life satisfaction were evaluated, using the questionnaire LISAT-11. Each factor was evaluated using a 1-10 scale, starting with 1-grade which was treated as very unsatisfactory, through grades 2, 3, 4, 5, 6 up to a very satisfactory grade. Statistical analysis was performed with the Chi2 test, the Mann-Whitney U test and the Kruskal-Wallis test. Results: The respondents estimated their feeling of life satisfaction in particular domains in a comparative way. The obtained results can be placed in a range from 4 to 5 points. Relationships with the partner and financial situation were assessed as the worst. Women before 40 years of age declared much higher level of life satisfaction than women over 55 years of age. Fundamental differences in assessing the seven domains (p

 Web of Science

Abstract

Translate 

Background

Decreased ovarian function and reserve is one of the complications of hysterectomy. This study compared the level of anti-Müllerian hormone (AMH) between total abdominal hysterectomy (TAH) and laparoscopic hysterectomy (TLH).

Tło

Zmniejszona czynność jajników i rezerwa jest jednym z powikłań histerektomii. W tym badaniu chcieliśmy porównać poziomy hormonu antymüllerowskiego (AMH) między całkowitą histerektomią brzucha (TAH) a całkowitą histerektomią laparoskopową (TLH).

Met

ody

W tym prospektywnym badaniu kohortowym poziomy AMH w surowicy porównano między grupami poddawany obustronnej salpingektomii TAH + i TLH, u 66 pacjentów (33 w każdej grupie), którzy skierowali się do szpitali Uniwersytetu Medycznego w Shiraz w celu histerektomii w ciągu jednego roku pracy. Zebrane informacje obejmowały wiek, wagę, ciężkość, parytet, regularność cyklu miesięczkowego, masę macicy, utratę krwi podczas operacji oraz poziom AMH w surowicy przed i 6 miesięcy po zabiegu, w porównaniu

między grupami.

Wyniki Większość

pacjentów (88% w TAH i 73% w grupie TLH) w wieku 40–50 lat. Średni wiek, waga, parytet pacjentów był podobny w obu grupach, podczas gdy utrata krwi była znacznie mniejsza w grupie TLH (P < 0,01). Mediana (IQR) przedoperacyjnych wartości AMH wynosiła 0,40 (0,55) ng/ml w grupie TLH i 0,92 (1,23) ng/ml w grupie TAH (P = 0,12), które zmniejszyły się do 0,29 (0,44) ng/ml w grupie TLH i 0,15 (0,31) ng/ml w grupie
